

VETIVER SYSTEMS FOR COMMUNITY DEVELOPMENT AND POVERTY ALLEVIATION IN INDONESIA

By

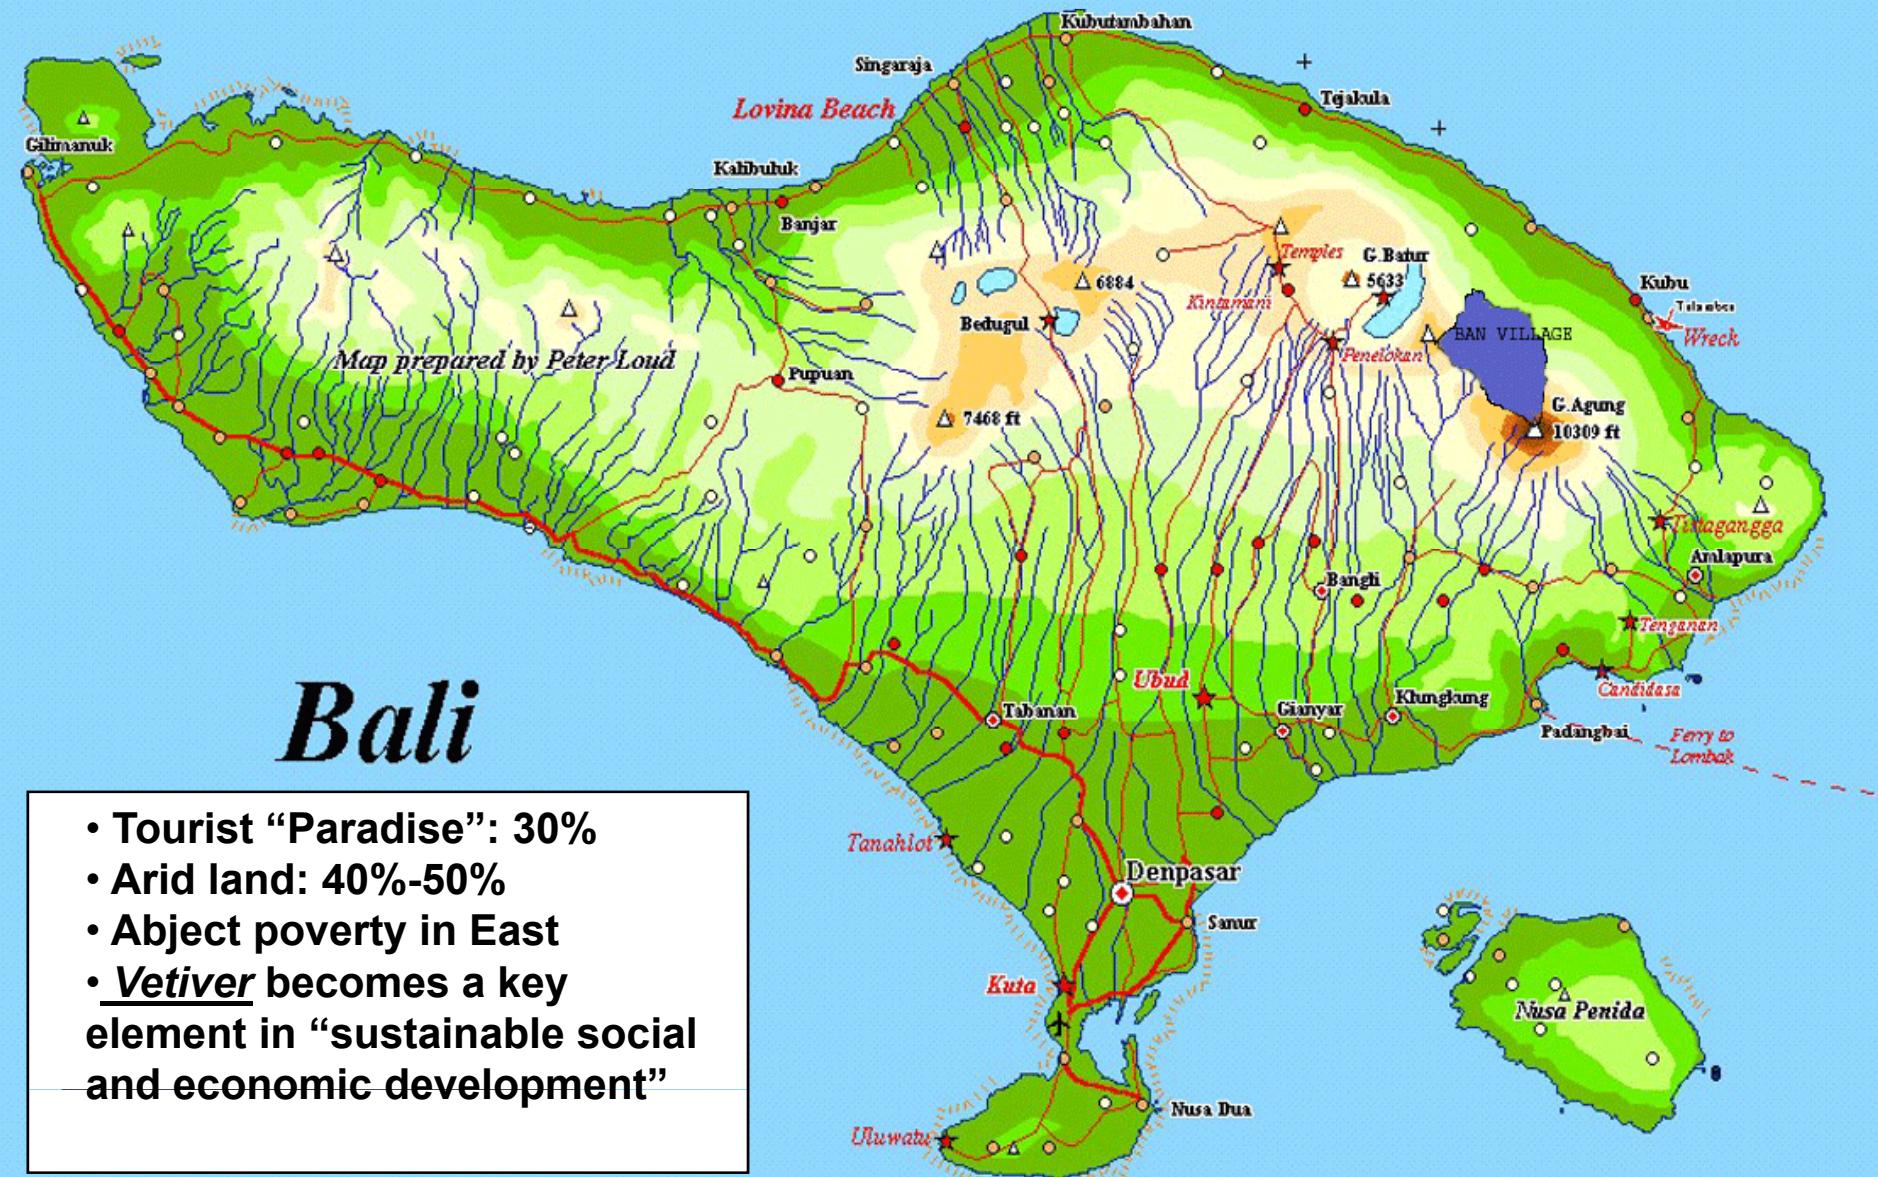

David Booth*, Ardika Adinata and Rosmara Dewi

**Coordinator Indonesian Vetiver Network,*

Director Ekoturin Foundation's East Bali Poverty Project, Bali Indonesia,

Bali

- Tourist “Paradise”: 30%
- Arid land: 40%-50%
- Abject poverty in East
- Vetiver becomes a key element in “sustainable social and economic development”

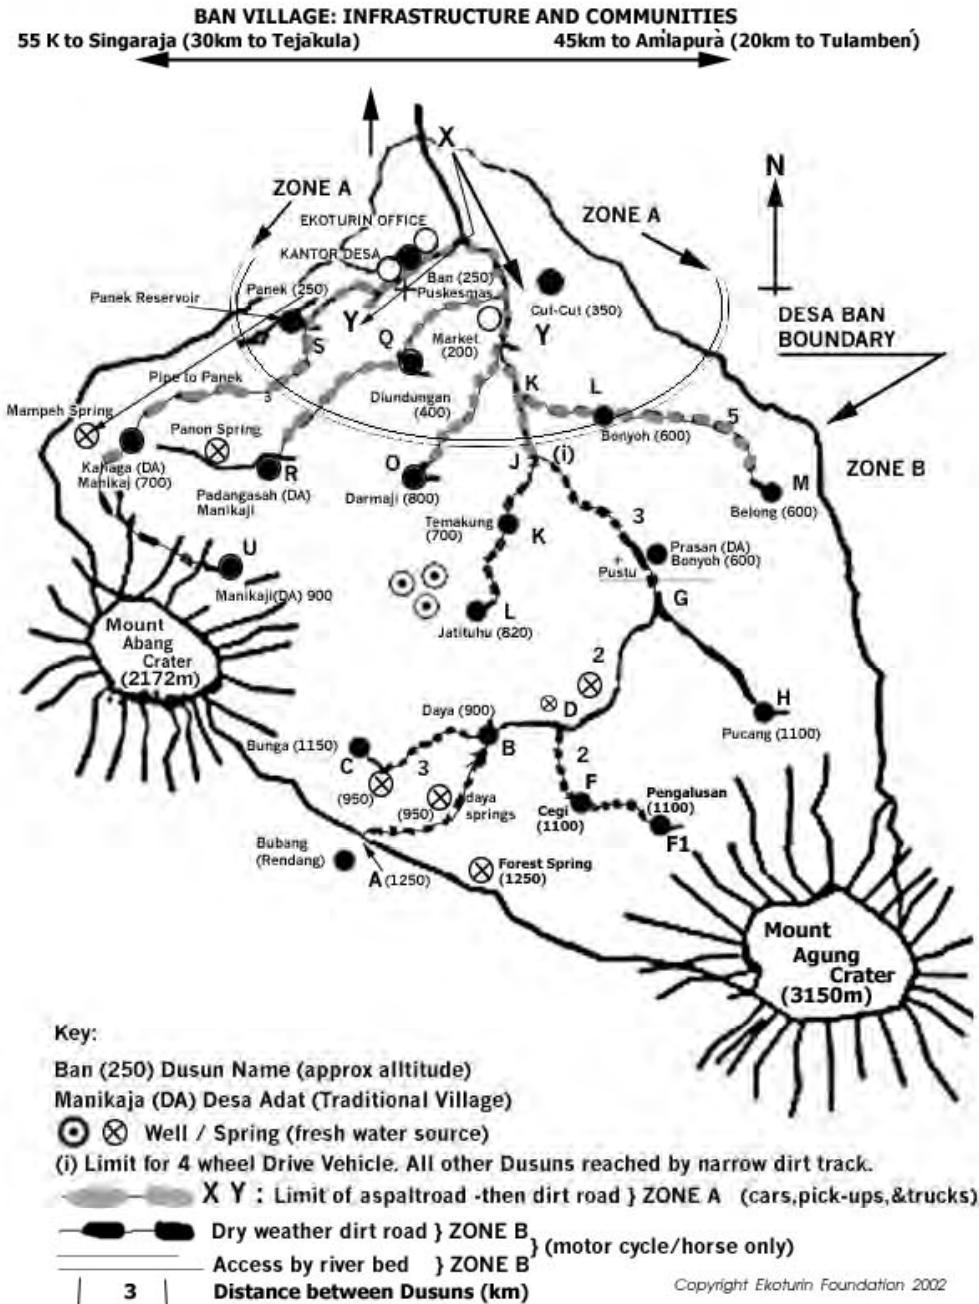

The barren east Bali mountain slopes

Cegi and Pengalusun hamlets at elevation of 1,100m on Mount Agung slopes

Map of Ban village

First Vetiver Planting: March 2000

The First Use of Vetiver Grass in March 2000 to stabilize new dirt road verges

Cegi kids learn Vetiver road erosion control

Vetiver protects new road for 2,500 families to leave village for first time

Watching Vetiver grows in bamboo pot in front of Cegi school as example for children & community

2,5m Vetiver root after one year planted

Children explain Vetiver Systems to foreign donors and supporters

Vetiver Introduction, Dissemination and Extension to Rural Farming Communities and Schools in Bali from 2000 to 2006

Year	Stages of Vetiver Systems Introduction for Poverty Alleviation	Pilot Vetiver Dissemination to Impoverished dry-land Subsistence Farming Communities to Empower by seeing Vetiver's Benefits and Sustainable Development Potential	Development of Vetiver Dissemination and Training for farming communities and schools - "Learning by Doing"
2000	Bio-engineering solution: Stabilize steep road verges, giving first-time access for thousands of people to health centres, markets and potential economic dev't	(i) Establish mutual trust between EBPP & community; (ii) clarify differences between vetiver & known grasses; (iii) use culturally sensitive benefits-based approach in awareness and education programmes in group discussions (iv) capacity building and empowerment to use vetiver for sustainable development and environmental improvement	1) Dissemination to illiterate farmers by sensitive " for the people by the people " vetiver field training 2) Vetiver training refreshed annually
2000 - 2001	Seeing Vetiver grow: Vetiver incorporated into school curriculum	(i) Children plant vetiver slip in tall sand-filled pot outside school to see root growth and slip development, (ii) Children plant first village vetiver hedges for school organic vegetable gardens on steep and arid volcanic land	1) EBPP trains and gives vetiver stock to Indonesian Permaculture Foundation (IDEP) to establish pilot permaculture Projects 2) EBPP trains South Bali school
2001 - 2006	Preventing farm soil erosion: Vetiver hedges support horizontal terraces for school organic vegetable gardens	(i) Parents " <i>see by example</i> " children's school gardens and are keen to learn and replicate on their land; (ii) children educate/train parents and establish family and community Vetiver nurseries; (iii) EBPP gives vetiver slips & training to Village Head	1) EBPP staff & children give Vetiver slips and training to 85 poor North Bali School on the school's steep and arid land; 2) Vetiver training & stock to poor North Bali Coast village
2002 - 2006	Food security, led by children: organic vegetable farming on steep and sandy land to replace cassava and corn as staple	(i) Participatory community discussions using conceptual "before, during and after" sketches initiated <i>new farmers' groups</i> to learn organic farming by " learning by doing ", (ii) local youths from all hamlets join EBPP's Vetiver Team as key trainers for farmers co-ops	1) EBPP gives vetiver to Bali's organic worm castings expert to include in her training for W & N Bali farmers' groups ; 2) 2005: EBPP's Vetiver training video produced, supplementing vetiver training
2004 - 2006	Preventing destruction of mountain spring safe water supplies for 1,300 families	Local community trained to plant vetiver to stabilize new soil fill after mountain spring water supply almost destroyed by torrential rains and also plant vetiver hedges to divert future flash floods.	1) 2006: " Vetiver Grass – A Hedge Against Erosion " 1 st Indonesian version 2) 2006: IDVN's 1st Vetiver Training workshop for Indonesian Government Forestry Rehabilitation specialists

No	Main Community Problems in 1998 Preventing Advancement or Change	Sustainable changes by December 2007, with Vetiver as the direct or indirect key
1	No vehicular access in or out from the south of this 7,200Ha village only steep, narrow and highly erosive mountain tracks.	Year round road access for 15,000 people: Over 27km of vetiver-protected dirt roads
2	Illiteracy: virtually all parents and almost 2,000 children illiterate due to no accessible schools or money to pay school costs.	More than 800 children have been educated in EBPP's schools since 1999
3	Year round erosion and little arable or productive farmland: Arid, rain fed volcanic ash, with average slopes of 40°.	Thousands of metres of vetiver hedges planted preventing hundreds of tons of soil erosion
4	Diet not adequate: The staple for most is cassava, sometimes mixed with corn and/or a little rice.	Nutritious vegetables are now available daily from vetiver-enabled school, community and individual kitchen gardens
5	Malnutrition & micronutrient deficiency: Up to 50% of infants malnourished; many children and adults had stunted growth.	Malnourishment of children virtually eliminated through (a) nutritious school meals, (b) iodine and vitamin A supplements and (c) nutritional supplements for 1,400 infants
6	Child mortality: 25% before one year old (EBPP survey 2000-2001);	Child mortality down to less than 1% due to better access, knowledge, nutrition and safe water consumption.
7	Iodine Deficiency Disorders (IDD): Palpable goitre in children aged 6-12: 84.5%	Only 20% of children had palpable goitre in August 2005 in Government Health Department survey
8	Safe Water Availability: NONE . Either a 2-3 hour walk to get water from the few remote wells or springs	As a result of vetiver stabilised mountain springs and access roads , over 1,400 families now have safe water supply
9	No Local Health facilities: average walking time to <i>Puskesmas</i> (community health centre) is 5-6 hours	Thanks to improved access roads facilitated by vetiver , EBPP established 27 Posyandu in the 19 hamlets since 2003
10	Very basic village market - no iodised salt, fish or nutritious vegetables sold, a root cause of malnutrition	All of the 3,000+ families now use the vetiver stabilised all-weather tracks
11	Cow Fodder scarce locally – requires 4-6km mountain trek:	Year round cow fodder now available at home from vetiver nurseries and vetiver hedges
12	3,000+ hectares of land denuded by 1963 Mount Agung eruption - extensive erosion, soil loss & ecosystem depletion.	Reforestation and carbon sequestration: started in 2007 with bamboo, Neem & Moringa, facilitated by vetiver hedges
13	Children have no future: destined to become cassava and corn farmers, as their parents and ancestors	Hundreds of EBPP educated children empowered with many skills to develop livelihoods & cooperatives

ERODED 2km DIRT ROAD TO BUNGA HAMLET IN 1999

2007
**VETIVER PROTECT ROAD
TO BUNGA HAMLET**

Vetiver protects many community access roads

Vetiver prevents destruction of essential mountain springs

February 2004: erosion on mountain spring before protected by vetiver

Vetiver prevents destruction of essential mountain springs

October 2004: Vetiver firmly established – permanent spring protection

Vetiver stabilizes volcanic sand fill for school construction (1)

Vetiver stabilizes volcanic sand fill for Bunga school building

Vetiver stabilizes more schools on complete fill embankments

Vetiver protect the Jatituhu school building

Vetiver planting at Darmaji school foundation, January 2008

Happy children develop 1st Vetiver nursery

Kids sort Vetiver in December 2000

Daya nursery starts on barren slopes

6 months later Vetiver excites the kids

2002: Typical Vetiver clump

Cegi children's school garden 2002+

March 2002: terraces cuts in barren hills

Dec. 2002: Vetiver facilities first harvest

Children learn in their organic garden

Kids' garden seen from afar: e.g. for all

Organic vegetables flourish in school gardens

Vetiver hedged path leading to Pengalusun school garden at 1,200m elevation

Organic Community Gardens: Parents keen to learn are taught by their children in EBPP Schools

Mature community organic vegetable gardens

First potato harvest in barren Bunga hills

Bunga trainee farmers sign agreement

Organic learning garden before Vetiver

Potatoes growing in stable terraces

First potato crop thanks to Vetiver terraces

COMMUNITY LEARNING GARDENS

ORGANIC VEGETABLE & HERB KITCHEN GARDENS

ORGANIC VEGETABLE & HERB KITCHEN GARDENS

EBPP's Ardika training farmers groups and school children in other disadvantaged rural villages how to benefit from Vetiver

Vetiver posters are a very powerful visual aid

Explaining simple hand measure for slip & root length

North Bali junior high school children listen.....

and practice what they learnt on barren school land

Vetiver & Sustainable Agriculture Training for PT Perum Perhutani and local farmers groups at EBPP Centre

Community Vetiver nurseries

New Jatituhu Vetiver nurseries for business & economic development

Clearing step land for new Jatituhu community Vetiver nursery, Feb 2008

Establishing new Vetiver nursery as community business in Jatituhu

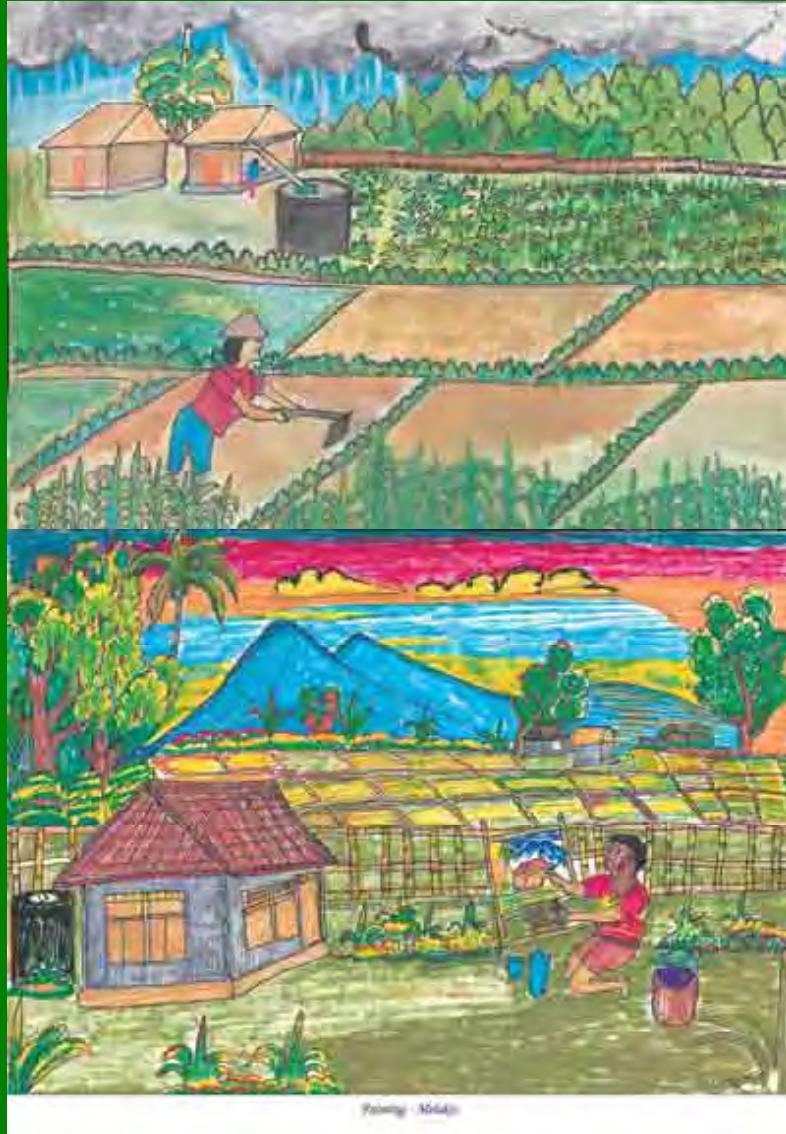

Preparing the Vetiver

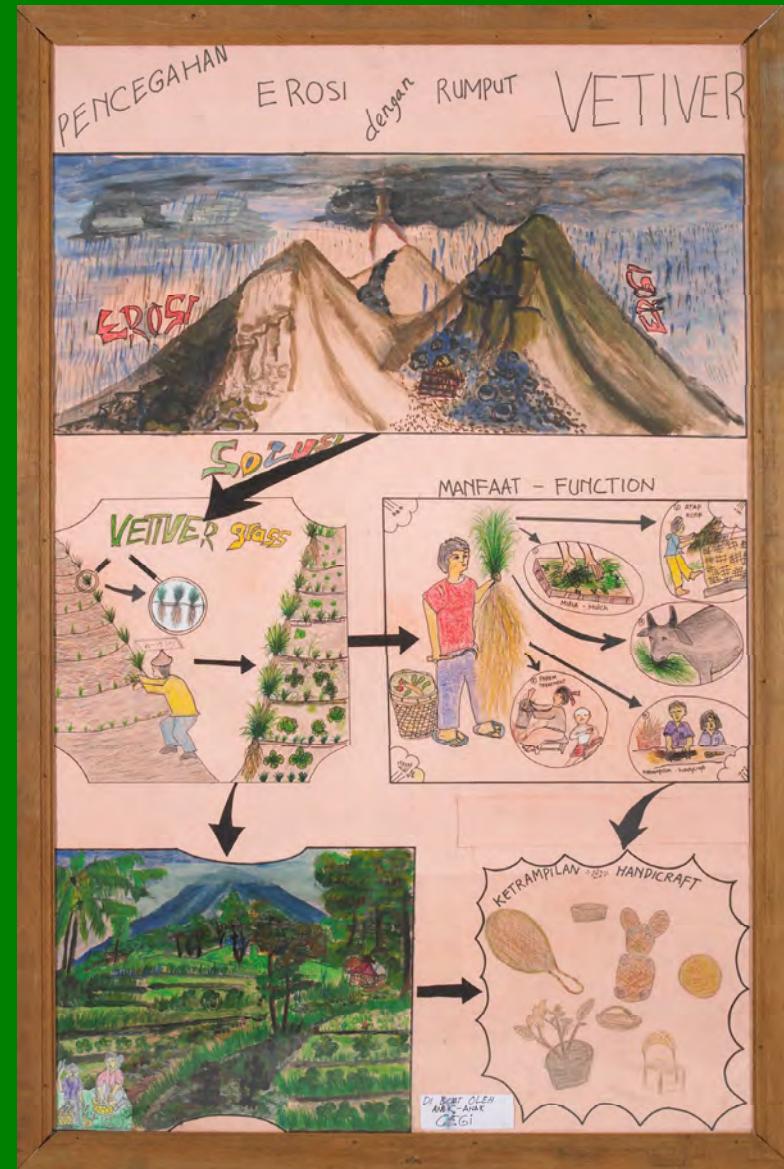

Planting Vetiver slips in new Jatituhu nursery

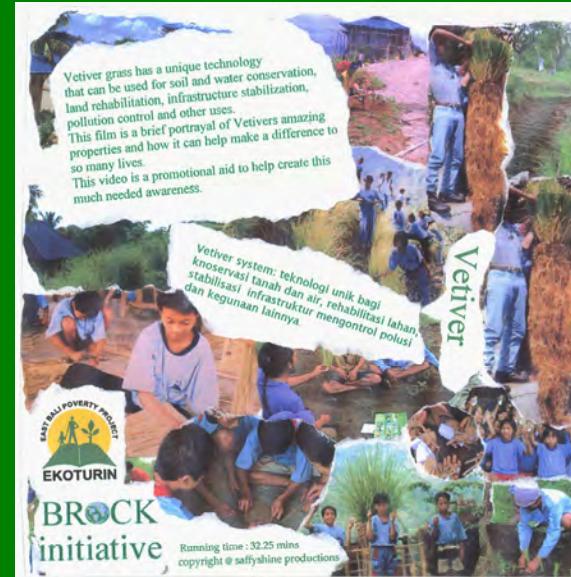

Vetiver in children's art & "The Art of Learning by Doing", the book of their lives

Vetiver Poster Created by EBPP Children

Vetiver Training video

Video shooting to create the Vetiver Training video

A photograph of a lush green hillside. In the foreground, a man in a light-colored shirt and dark pants is bent over, working in tall green grass or crops. In the middle ground, another person is visible further up the slope. The background shows dense green trees and foliage under a clear sky.

**THANK YOU FOR
LISTENING**
